

Under a microscope you will be able to see that glass is not flat. There are peaks and valleys that leave the glass vulnerable to road debris, making it easy to chip and crack. When a stone glances off your windshield it can catch one of these peaks or valleys and damage your windshield.

The thousands of peaks and valleys in your windshield also refract light. When light is refracted it creates a blurry image or what we perceive as road glare.

The third element that occurs with these peaks and valleys is moisture. Water grips these peaks and valleys and hangs on your windshield. In freezing conditions, ice will stick to these peaks and valleys making the removal of ice and snow difficult..

### THE NATURE OF GLASS

A glass windshield is not naturally smooth. By applying the Supra ClearArmor windshield treatment you eliminate the three elements above, giving you a stronger windshield, clearer vision by reducing glare, and the ability to remove ice, snow and even insects with ease.
